

Daily Digest — Quick Start

A one-page morning briefing built with Claude in Cowork. Modular — you decide what's in it.

What this is

Every weekday morning, Claude prepares a short briefing for you. You choose the scope when you set it up — the digest is modular:

- **News only** — headlines on whichever topics, sectors and regions you care about. A simple data-gathering exercise across public web sources. **No connector needed.** *The simplest version — what most people start with.*
- **News + today's calendar** — add a quick line-by-line view of your meetings. **Requires the Microsoft 365 Connector in Cowork.**
- **News + calendar + a to-do list from your inbox / Teams** — the most powerful version. **Requires the Microsoft 365 Connector in Cowork** (which your organisation may or may not allow).

Before you start

For a **news-only** digest you don't need anyone's permission — the digest only touches public web content. For the **calendar** or **to-do** options, you'll be giving Claude read-access to your work email, chats and/or calendar via the **Microsoft 365 connector in Cowork**; if it isn't already installed, Claude will walk you through connecting it in step 4 below. **Check with your IT department or supervisor first** if your organisation has policies on AI tools reading internal data — regulated sectors (legal, finance, healthcare, government, defence) commonly restrict this. A 30-second check now can save a much bigger conversation later.

How to use it (5 steps, about 10 minutes)

1. Download the file **Daily Digest — Setup Guide.md** and save it somewhere easy to find.
2. Open a fresh Cowork chat. Attach the .md file by drag-and-drop or the paperclip icon.
3. Type: **“Read this guide and follow it — set me up with a daily digest.”**
4. Claude first asks how much you want in the digest (news-only, +calendar, or +to-dos), then walks you through the relevant questions for that scope and helps you connect any Cowork connectors you'll need.
5. Claude builds the skill as a **one-click installable .skill file**, sets up the scheduled task, and walks you through a brief Windows-side setup if you chose the local-file delivery method. Test once. Done.

Three ways the digest can land on your screen each morning

Method	How it lands	Best when
Google Calendar invite	Outlook auto-adds a tentative meeting with the digest in the body	Any scope — but for the to-do version, check IT allows routing work content through a personal Google account
Local file + browser popup	A browser tab pops open at your chosen time, showing the digest	Most secure — nothing leaves your PC. Works for any scope
Outlook Classic .ics	Outlook opens a meeting form; click Save to add to calendar	You use classic Outlook and want an Outlook-native feel (does not work in new Outlook)

After setup

Change anything later (different time, different topics, broader or narrower scope): open Cowork, say *“update my daily digest”*.

Pause temporarily: Cowork → Scheduled section → find the daily-digest task → toggle Enabled off.

Stop entirely: same place, delete the task.

If a morning run doesn't work: open Cowork, re-attach the guide, say *“my digest didn't fire today, help me debug”*.

The Setup Guide MD file explains each option in plain language and walks through every step. You only need this one-pager to get started.
